Differentiation

Suppose that f(x) is continuous on [a,b] and let $P=(x_0,f(x_0))$ and $Q=(x_0+h,f(x_0+h))$ on the graph of f(x):

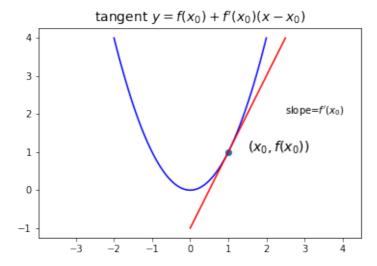

Then the slope of $\overset{\longleftrightarrow}{PQ}$, secant line passing through P and Q, is $\mathbf{m}=\lim_{\mathbf{h}\to 0}\frac{\mathbf{f}(\mathbf{x}_0+\mathbf{h})-\mathbf{f}(\mathbf{x}_0)}{\mathbf{h}}$

$$m=\lim_{h\to 0}\frac{f(x_0+h)-f(x_0)}{h}$$

so called Newton quotient of f(x) at $x = x_0$. If the limit of m as h approaches 0 exists, it is called the derivative of f(x) at $x = x_0$, i.e. it is the slope of tangent line of f(x) passing through $(x_0, f(x_0))$, and denoted as $f'(x_0)$. The process for finding derivative is called differentiation.

```
In [1]: %matplotlib inline
        import numpy as np
        import matplotlib.pylab as plt
```

```
In [2]: x=np.linspace(-2,2,101)
          plt.plot(x,x**2,"-b")
          plt.plot([0,2.5],[-1,4],'-r')
          plt.scatter([1],[1])
          plt.text(1.5,1,'$(x_0,f(x_0))$',size=14)
nl+ +ext(2.5,2 'slone=$f\'(x_0)$')
```

Remarks

There are several symbols for derivatives as follows:

1. the derivatives value of f(x) at $x = x_0$:

$$f'(x_0) = \frac{d}{dx}f(x)\Big|_{x=x_0} = \frac{d}{dx}f(x_0) = D_x f(x_0)$$

• the derivative of f(x):

$$f'(x_0) = \frac{d}{dx}f(x) = D_x f(x)$$

- a). |x| is differentiable everywhere except at x = 0.
- b). Neither $x^{1/3}$ nor $x^{2/3}$ are not differentiable at x=0.

Theorem

If f(x) is differentiable at x = a, then f(x) is continuous at x = 0.

Proof

$$\lim_{x \to a} |f(x) - f(a)| = \lim_{x \to a} \left| \frac{f(x) - f(a)}{x - a} \right| \cdot |x - a|$$
$$= |f'(a)| \cdot 0$$

This means $\lim_{x\to a} f(x) = f(a)$, i.e. f(x) is continuous at x=a.

Example

Suppose that

$$f(x) = \begin{cases} x \sin(1/x), & \text{if } x \neq 0, \\ 0, & \text{if } x = 0 \end{cases}$$

Then f(x) is continuous for any real number by the squeeze value theorem. And the derivative at x=0, is as follows:

$$f'(0) = \lim_{h \to 0} \frac{f(h) - f(0)}{h}$$
$$= \lim_{h \to 0} \frac{h \sin(1/h)}{h}$$
$$= \lim_{h \to 0} \sin(1/h)$$

This concludes that the limit fails to exist.

Example

The derivative of sine function is derived as follows:

$$(\sin x)' = \lim_{h \to 0} \frac{\sin(x+h) - \sin x}{h}$$

$$= \lim_{h \to 0} \frac{\sin x \cos h + \cos x \sin h - \sin x}{h}$$

$$= \lim_{h \to 0} \left(\sin x \frac{\cos h - 1}{h} + \cos x \frac{\sin h}{h}\right)$$

$$= \cos x$$

since $\lim_{h\to 0} \frac{\sin h}{h} = 1$ and $\lim_{h\to 0} \frac{\cos h - 1}{h} = 0$.

Exercises, p153

(61). Let

$$f(x) = \begin{cases} x^2 \sin(1/x), & \text{if } x \neq 0, \\ 0, & \text{if } x = 0, \end{cases}$$

a). f(x) is differentiable at x = 0 and f'(0) = 0.

$$f'(0) = \lim_{h \to 0} \frac{f(h) - f(0)}{h}$$
$$= \lim_{h \to 0} \frac{h^2 \sin(1/h) - 0}{h}$$
$$= \lim_{h \to 0} h \sin(1/h) = 0$$

The last hols since

$$|h\sin(1/h)| \le |h| \to 0 \text{ as } h \to 0$$

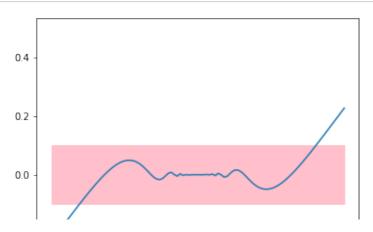

b). Its image for $(x, y) \in [-0.5, 0.5] \times [-0.1, 0.1]$. Reference the following picture.

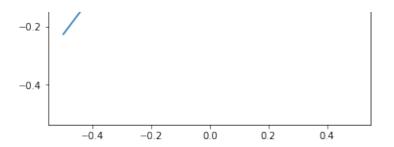

True or False

```
(66). If f(x) is differentiable at x=a, and g(x) is not differentiable at x=a, then fg(x) is not differentiable at x=a. ( ). (67) If both f(x) and g(x) are not differentiable at x=a, then fg(x) is not differentiable at x=a. ( ). (68) If both f(x) and g(x) are not differentiable at x=a, then f+g is not differentiable at x=a. ( ). (69). The domain of f'(x) is the same as f(x). ( ). (70). If n \in \mathbb{N}, the there exists a function f such that f is differentiable everywhere except at f number. ( ).
```

```

2.2 Rules of Differentiation

- 1. (c)' = 0 for any constant c.
- $(x^n)' = nx^{n-1}$ for x > 0 and $n \in \mathbb{R}$. Here, a example for n = -1:

$$\left(\frac{1}{x}\right)' = \lim_{h \to 0} \frac{\frac{1}{x+h} - \frac{1}{x}}{h}$$

$$= \lim_{h \to 0} \frac{x - (x+h)}{xh(x+h)}$$

$$= \frac{-1}{x^2}$$

- $(f \pm g)' = f' \pm g'$,
- $(f \cdot g)' = f'g + g'f$, $(f/g)' = (f'g g'f)/g^2$ suppose that $g(x) \neq 0$ for any x, (Power Rule) $(x^r)' = rx^{r-1}$ for r > 0,

• (Chain's Rule)
$$(f \circ g)' = (f(g(x)))' = f'(g(x))g'(x)$$

• $(f(g(x)))' = \frac{df(g(x))}{d / g(x)} \cdot \frac{d / g(x)}{dx}$

The following diagram says everything about chain's rule:

$$g'(x) \qquad \times \qquad f'(u)$$

$$\downarrow \qquad \qquad \downarrow$$

$$f'(g(x))g'(x)$$

- $(\sin x)' = \cos x$, $(\cos x)' = -\sin x$, $(\tan x)' = \sec^2 x$, $(\cot x)' = -\csc^2 x$, $(\sec x)' = \sec x \tan x$, $(\csc x)' = -\csc x \cot x$;
- (Logarithmic Rule):
 - $(\ln x)' = (\log_e x)' = 1/x$, where $\ln(\bullet)$ means logarithm with base $e \cong 2.71428 \cdots$ where e, Euler number, is an irrational number;
 - $(\log_a x)' = 1/(x \ln a)$ where a > 0;
- (Exponential Rules):
 - $(e^x)' = e^x$;
 - $(a^x)' = a^x \ln a$, where a > 0 and $a \ne 1$.

$$\left(\frac{\sin x}{1 - \cos x}\right)' = \frac{(\sin x)'(1 - \cos x) - \sin x(1 - \cos x)'}{(1 - \cos x)^2}$$
$$= \frac{\cos x(1 - \cos x) - \sin x \sin x}{(1 - \cos x)^2}$$
$$= \frac{1}{\cos x - 1}$$

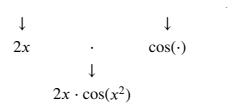

Example

$$[(1+x^2)^{100}]' = 2x \cdot 100(1+x^2)^{99} = 200x(1+x^2)^{99}$$

Example

$$\left(\sin(x^2)\right)' = 2x\cos x^2$$

$$\begin{array}{ccc} x^2 & & \sin(\cdot) \\ x & \longrightarrow & x^2 & \longrightarrow & \sin(x^2) \end{array}$$

 $(\sin^2 x)' = 2\sin x \cos x$

$$\begin{array}{cccc}
\sin x & & & & & & & \\
x & \longrightarrow & & \sin x & \longrightarrow & \sin^2(x) \\
\downarrow & & \downarrow & & \downarrow \\
\cos x & \cdot & & 2(\cdot) & & \\
& & & & & \\
\cos x \cdot 2(\sin x) & & & \\
\end{array}$$

```
In [40]: from sympy import Symbol, diff,sin,cos,sqrt,pprint,Function,tan

12=diff(g,x)
print("f'(g(x)) =",11*12,", where g(x) = u = ",g)
```

Examples

```
Differentiate a) \sqrt{2x^2 - 1} b). u = x^3 + 1, u^3 - u^2 + u + 1 c). 3\cos x^2
```

```
f'(g(x)) = -6*x*sin(u), where g(x) = u = x**2
```

```
In [31]: ChainRule(tan(u)*tan(u)*tan(u), 3*x*x+1)
f'(g(x)) = 6*x*(3*tan(u)**2 + 3)*tan(u)**2 , where g(x) = u = 3*x
**2 + 1
```

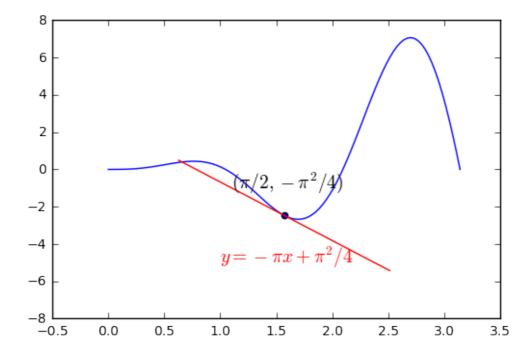

Find the tangent line of $f(x) = x^2 \sin 3x$ at $x = \pi/2$

```
a). (x^2 \sin 3x)' = 2x \sin(3x) + x^2 \cdot 3\cos 3x \Big|_{x=\pi/2} = -\pi
b). f(\pi/2) = -\pi^2/4
```

c). tangent line: $(y-f(\pi/2))=f'(\pi/2)(x-\pi/2)$, i.e. $y+\pi^2/4=-\pi(x-\pi/2)$

```
In [46]: from numpy import pi,sin
    x=np.linspace(0,pi,101)
    plt.plot(x,x*x*sin(3*x))
    t=x[20:-20]
    f=-pi*t+pi*pi/4
    plt.plot(t,f,color='red')
    plt.scatter([pi/2],[-pi*pi/4])
    plt.text(1.1,-1,'$(\pi/2,-\pi^2/4)$',size=14)
    plt.text(1,-5,'$y=-\pi x+\pi^2/4$',size=14,color='red')
```

Out[46]: <matplotlib.text.Text at 0x10bbc6ef0>

Differentiate the following function, x^x .

Right or Wrong

- If it is a power function, then $(x^x)' = xx^{x-1} = x^x$;
- If it is an exponential function, then $(x^x)' = x^x \ln x$.

But it is neither power function nor exponential function. Then we have to modify it to be one of them. As well known, $2=10^{\log_{10}2}$, then

$$x^x = e^{x \log_e x} = e^{x \ln x}$$

Then

i.e.
$$(x^x)' = (1 + \ln x)x^x$$
.

Higher-order Derivatives

Suppose that f(x) is smooth function; the second order derivative is defined as follows:

$$f''(x) = \frac{d^2}{dx^2}f(x) = D_x^2 f(x) = \frac{d}{dx}f'(x)$$

And the more higher order derivatives, (n-th)-order for instance, are defined by the recurive formula:

$$f^{(3)}(x) = \frac{d^3}{dx^3} f(x) = D_x^3 f(x) = \frac{d}{dx} f''(x)$$

$$\vdots$$

$$f^{(n)}(x) = \frac{d^n}{dx^n} f(x) = D_x^n f(x) = \frac{d}{dx} f^{(n-1)}(x)$$

p. 159

Investigate the derivatives of $f(x) = x^2 \sin x$.

Sol:

The first order of derivative is:

$$f'(x) = (x^2 \sin x)'$$
$$= (x^2)' \sin x + x^2 (\sin x)'$$
$$= 2x \sin x + x^2 \cos x$$

And the second order derivative is:

$$f''(x) = (x^{2} \sin x)''$$

$$= (2x \sin x + x^{2} \cos x)'$$

$$= (2x)' \sin x + 2x(\sin x)' + (x^{2})' \cos x + x^{2}(\cos x)'$$

$$= 2 \sin x + 2x \cos x + 2x \cos x - x^{2} \sin x$$

$$= 2 \sin x + 4x \cos x - x^{2} \sin x$$

Exactly, the last result is equal to the following:

$$C(2,0)(x^2)'' \sin x + C(2,1)(x^2)'(\sin x)' + C(2,2)x^2(\sin x)''$$
 where $C(n,k) = n!/k!(n-k)!$ and $n! = 1 \cdot 2 \cdot 3 \cdots n$, the factorial of n .

This relation can be extended to the more higher differentiation:

$$f^{(n)} = (x^2 \sin x)^{(n)}$$

$$= C(n,2)(x^2)''(\sin x)^{(n-2)} + C(n,1)(x^2)'(\sin x)^{(n-1)} + C(n,0)x^2(\sin x)^{(n)}$$

$$= n(n-1)(\sin x)^{(n-2)} + 2nx(\sin x)^{(n-1)} + x^2(\sin x)^{(n)}$$

By the last result, the derivative of 10-th order is

$$f^{(10)}(x) = 90\sin x + 20x\cos x - x^2\sin x$$

Implicit Differentiation

Definition

F(x, y) = 0 is called equation of x and y of y is called an implicit function of x.

Example

The circle, $x^2 + y^2 = r^2$, is a famous known equation. And how do we find the tangent line at the point on the circle? Implicit differentiation says that y can be treated as function of x locally, i.e. y = y(x). Then

$$x^{2} + (y(x))^{2} = r^{2}$$

$$\Rightarrow [x^{2} + (y(x))^{2}]' = [r^{2}]' \text{ by differentiating both sides}$$

$$\Rightarrow 2x + 2y(x)y'(x) = 0$$

$$\Rightarrow y'(x) = -\frac{x}{y(x)} \text{ if } y(x) \neq 0$$

This means that y'(x) depends on both x and y. For example,

• At
$$(x, y) = (1/\sqrt{2}, 1/\sqrt{2}), y'(x) = -\sqrt{2}/\sqrt{2} = -1;$$

• at
$$(x, y) = (-3/5, 4/5), y'(x) = -[(-3/5)/(4/5)] = 3/4$$

Example

Find out y'(x) if $x^3 + y^3 - 3xy = 0$.

By implicit differention:

$$[x^{3} + y^{3} - 3xy]' = 0$$

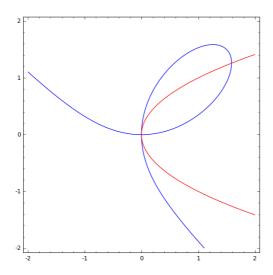

$$\implies 3x^{2} + 3y^{2}y' - 3(y + xy') = 0$$

$$\implies y'(3y^{2} - 3x) = 3(y - x^{2})$$

$$\implies y' = \frac{x^{2} - y}{x - y^{2}}$$

if $y^2 - x \neq 0$ or $x \neq y^2$.

Why no Derivative at (x, y) = (0, 0) and $(2^{2/3}, 2^{1/3})$

It's very clear:

- the curve of $x^3 + y^3 3xy = 0$ crosses origin, (0,0), twice with different tangent; and this is why its tangent can't exist at origin even that the tangent lines exist.
- The latter case, it is obvious that there exists a vertical tangent line at the case, i.e. $f'|_{(2^{2/3},2^{1/3})} = \infty$, does not exist.

Note

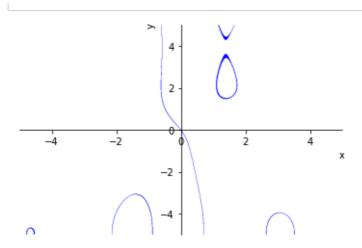

Above image was created by another CAS, <u>Sage (www.sagemath.org)</u>, which owns powerful plotting functionalities for math works.

```
In [22]: from sympy import Function, solve, Derivative
           y=Function("y")
           y=y(x)
 In [23]: l=diff(x**3+y**3-3*x*y,x);
 Out[23]: 3*x**2 - 3*x*Derivative(y(x), x) + 3*y(x)**2*Derivative(y(x), x) -
           3*y(x)
  In [9]: solve(l,Derivative(y,x))
  Out[9]: [(x**2 - y(x))/(x - y(x)**2)]
 In [24]: def ImplicitDiff(express):
               l=diff(express,x);
               print("y'(x) = ", solve(l, Derivative(y, x))[0])
  In [1]: from sympy.plotting import plot_implicit
           from sympy import symbols, Eq, solve
           x, y = symbols('x y')
           def ImplicitPlot(express):
               eq = Eq(express)
               plot_implicit(eq)
 In [25]: ImplicitDiff(x**3+y**3-3*x*y)
          y'(x) = (x**2 - y(x))/(x - y(x)**2)
 In [26]: ImplicitDiff(x**2*y+y+cos(x)+1)
          y'(x) = (-2*x*y(x) + \sin(x))/(x**2 + 1)
 In [27]: ImplicitDiff(y**4-2*y**3+x**3*y**2-\cos(x)-8)
          y'(x) = -(3*x*2*y(x)**2 + \sin(x))/(2*(x**3 + 2*y(x)**2 - 3*y(x))*
          y(x)
Example
Evaluate y'(x) for x \sin y - y \cos 2x = 2x at (x, y) = (\pi/2, \pi)
 In [28]: ImplicitDiff(x*sin(y)-y*cos(2*x)-2*x)
          y'(x) = (-2*y(x)*sin(2*x) - sin(y(x)) + 2)/(x*cos(y(x)) - cos(2*x)
          )
```

In [4]: from sympy import sin, cos, exp

%matplotlib inline

ImplicitPlot(x*sin(y)-y*cos(2*x)-2*x)

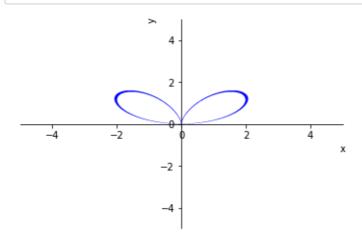

Thus

$$y'(x)|_{(x,y)=(\pi/2,\pi)} = \frac{-2\pi \sin \pi - \sin \pi + 2}{\pi/2 \cos \pi - \cos \pi} = \frac{4}{2-\pi}$$

Example

Find an equation of tangent line of $4x^4 + 8x^2y^2 - 25x^2y + 4x^4 = 0$ at (x, y) = (2, 1)

In [29]: ImplicitDiff(
$$4*x**4+8*x**2*y**2-25*x**2*y+4*y**4$$
)
$$y'(x) = 2*x*(-8*x**2 - 8*y(x)**2 + 25*y(x))/(16*x**2*y(x) - 25*x**2 + 16*y(x)**3)$$

The slope is $y'=2\times 2(-8\times 2^2-8+25)/(16\times 2^2-25\times 2^2+16)=3$. Thus the tangent line is (y-1)=3(x-2)

10. Find
$$y'(x)$$
 if $\frac{x+y}{x-y} = y^2 + 1$, #16. $x + y^2 = \cos xy$

- **36.** tangent line of $2y^2 x^3 x^2 = 0$ at (1, 1).
- **42.** normal line of $x^5 2xy + y^5 = 0$ at (1, 1).
- **44.** tangent line of $x^{2/3} + y^{2/3} = 1$ at $(3\sqrt{3}, 1)$

since m = 1, tangent line is (y - 1) = x - 1.

```
In [20]: #42.
ImplicitDiff(x**5-2*x*y+y**5)

y'(x) = (5*x**4 - 2*y(x))/(2*x - 5*y(x)**4)
```

slope of normal line is negative inverse of tangent line, n = -1/m = 1, tangent line is (y - 1) = x - 1.

In [21]: #44.
ImplicitDiff(
$$x**(2/3)+y**(2/3)-4$$
)

$$y'(x) = -y(x)**(1/3)/x**(1/3)$$

since $m = -\sqrt{3}$, tangent line is $(y - 1) = -\sqrt{3}(x - 3\sqrt{3})$.

Inverse of Function

Inverse Differentiation

Suppose that the inverse of y = f(x) exists and is equal to $x = f^{-1}(y)$. Then

$$\frac{dx}{dy} = \frac{1}{dy/dx}$$

i.e.

$$\left(f^{-1}(y)\right)' = \frac{1}{f'(x)}$$

Example

The inverse of sin is defined as follows:

$$y = \sin^{-1} x \text{ if } x = \sin(y), \text{ for } y \in (-\pi/2, \pi/2)$$

$$\frac{d\sin^{-1} x}{dx} = \frac{dy}{dx}$$

$$= \frac{1}{dx/dy}$$

$$= \frac{1}{d(\sin y)/dy}$$

$$= \frac{1}{\cos y} = \frac{1}{\sqrt{1 - \sin^2 y}} = \frac{1}{\sqrt{1 - x^2}}$$

Note

Other derivatives for inverse trigonometric functions are:

•
$$(\operatorname{Tan}^{-1}(x))' = \frac{1}{1+x^2}$$
,
• $(\operatorname{Sec}^{-1}(x))' = \frac{1}{|x|\sqrt{x^2-1}}$,

```
